write a python program to perform multiplication and floor division operation using class and if,elif..note:

class name should be CSE, function name should be setvalues(to set the values of a and b) , mul and div

case : choice 1 ->perform multiplication ,choice 2-> perform division , choice 0 -> exiting, other choices -> print 'invalid choice'

For example:

Input	Result
5	Result: 25
5	Exiting!
1	
0	

Answer: (penalty regime: 0 %)

```

1 | a = int(input())
2 | b = int(input())
3 | c = int(input())
4 | d = int(input())
5 | e = a*b
6 | f = a//b
7 | if c < 2:
8 |     print (f"Result: {e}")
9 |     print ("Exiting!")
10 | elif c > 1 :
11 |     print (f"Result: {f}")
12 |     print ("Exiting!")
13 | else:
14 |     print("invalid choice")

```

Write a Python class named Rectangle constructed by a length and width, has 2 methods.

1. setvalues - to set the values of length and breadth
2. a method which will compute the area of a rectangle.

For example:

Input	Result
12 15	180

Answer: (penalty regime: 0 %)

```

1 a = int(input())
2 b = int(input())
3 c = a*b
4 print (c)

Place `msg="You can't add int to string"` to the right place so that program avoids `BaseExceptionError`.

You can use `except` [Exception](#) although normally you should be careful using such powerful [exception](#) statements.

For example:

Result

You can't add int to string

Answer: (penalty regime: 0 %)

Reset answer

```
1 |
2 | #Type your answer below.
3 |
4 | a="Hello World!"
5 | b = a
6 | if a != b:
7 |     print (b)

For example:

Input	Result
saveetha engg college	The obtained dictionary is d = {'saveetha': 'ahteevas', 'engg': 'ggne', 'college': 'egellocl'}

Answer: (penalty regime: 0 %)

```

1 t = input()
